

Case Study: Revolutionizing High-Intent Lead Capture for CryptoBill

Executive Summary

This project overhauled the "Book a Demo" experience for **CryptoBill**, a B2B service providing seamless crypto payment integration for businesses. By transitioning from a traditional single-step form to a **two-step automated scheduling flow** with a persistent recovery sequence, we addressed significant friction in the lead funnel.

The redesign resulted in a **3.5x increase in conversion rates**. Furthermore, **17% of users** who initially abandoned the booking step were successfully recovered through the automated email sequence—a feature entirely absent in the previous iteration.

User Personas

To guide the design, we focused on two high-value segments seeking lower commissions and transparent, expert-led consultations.

Feature	Persona 1: The E-Commerce Innovator	Persona 2: The Retail Scaling Expert
Name	Alex Rivera	Marcus Thorne
Role	Founder & CEO of a Global Boutique D2C Brand	COO of a Regional Luxury Retail Chain
Pain Point	High cross-border transaction fees and slow settlements.	Complexity of traditional banking for international vendors.
Goal	Integration of a "future-proof" payment method to reduce	A transparent, expert-led consultation to ensure compliance.

	commissions.	
Tech Level	High; looking for "plug-and-play" API solutions.	Moderate; prioritizes security and a clear demo walkthrough.

The Strategy: Frictionless Qualification & Persistent Recovery

Step 1: The Smart Qualifier

The first step focuses on capturing **Minimum Viable Data** to identify and qualify the lead without causing fatigue.

- **Compliance Gating:** As a fintech service, the "Country of Incorporation" field acts as an immediate compliance check.
- **Lead Tiering:** We capture "Expected Monthly Volume" to route the lead to the correct internal representative.
- **Friction Reduction:** The flow avoids blocking VPN users by checking restricted regions *after* submission.

Step 2: The High-Intent Scheduler

Once qualified, the user is moved to a Calendly embed.

- **Seamless Transition:** Name and email are pre-filled from Step 1 to eliminate repetitive typing.
- **Psychological Triggers:** A **30-minute timer** creates a sense of urgency.
- **Attention Recovery:** If a user gets distracted, a **5-minute orange warning banner** appears to re-engage them before the session expires.

The Lead Recovery Ecosystem

The core driver of the 17% recovery rate was the **7-email automated sequence** designed specifically for users who completed Step 1 but abandoned Step 2. Since these users already

provided their contact data and intent, they are treated as "warm" leads.

Key Touchpoints in the Sequence:

- **Email 1 (Immediate):** Sends a direct session link while the intent is fresh.
- **Email 2 (+2 Hours):** A gentle nudge to help them find a time that works.
- **Email 3 (+24 Hours):** A value-based reminder of how CryptoBill solves their specific pain points.
- **Emails 4–7:** A progressive 30-day nurture cycle including "Is CryptoBill right for you?" checklists and final "Request Expiring" notices to close the loop.

Results & Impact

- **Conversion Lift:** The new design outperformed the previous form by **350% (3.5x)**.
- **Lead Recovery:** **17%** of total demo bookings now come from the email follow-up links, a segment that was previously lost entirely.
- **Operational Efficiency:** By showing real-time availability and pre-filling data, we eliminated back-and-forth scheduling emails.
